ALAN J. BISHOP Monish University, Clayton, Victoria, Australia RATIONALE Mathematics Education is becoming a well-documented field with many books, journals and international conferences focusing on a variety of aspects relating to theory, research and practice. That documentation also reflects the fact that the field has expanded enormously in the last twenty years. At the 8th International Congress on Mathematics Education (ICME) in Seville, Spain, for example, there were 26 specialist Working Groups and 26 special ist Topic Groups, as well as a host of other group activities. In 1950 the ‘Commission Internationale pour l’Etude et l’Amélioration de l’Enseignement des Mathematiques’ (CIEAEM) was formed and twenty years ago another active group, the ‘International Group for the Psychology of Mathematics Education’ (PME), began at the third ICME at Karlsruhe in 1976. Since then several other specialist groups have been formed, and are also active through regular conferences and publications, as documented in Edward Jacobsen’s Chapter 34 in this volume.

A unique collection of qualitative and ethnographic studies of differing groups of young people. It examines inequality in all its complexity in the lived experience of youth and shows the continued pervasive influence of class and gender. The groups studied range from young women in private education to youth training “lads” and gives vivid and insightful accounts of their social existence. Their diverse experiences are explored in the context of family, education, training, work and politics. The contributors consider for example, family and educational processes, social divisions and control, identities and opportunities, “enterprise” careers and cultural resistance in the context of late/post modern transitions. “Youth and Inequality” is aimed particularly at students and researchers in the social sciences, education and cultural studies and should also be of interest to all those professionally engaged with young people.

For three months in the spring of 1994, the African nation of Rwanda descended into one of the most vicious and bloody genocides the world has ever seen. Immaculee Ilibagiza, a young university student, miraculously survived the savage killing spree that left most of her family and friends, and more than a million of her fellow citizens, dead. As hundreds of killers hunted for her, Immaculee formed a profound and transforming relationship with God that transcended the bloodshed and butchery - a relationship that enabled her to emerge from the slaughter with a spirit guided by hatred and a heart brimming with forgiveness. Immaculee’s astonishing story of survival was documented in her first book (with Steve Erwin), LEFT TO TELL. In LED BY FAITH, Immaculee takes us with her as her remarkable journey continues. Through her simple and eloquent voice, we experience her hardships and heartache as she fights to survive and find meaning and purpose in the aftermath of the genocide. Immaculee tends off sinister new predators, seeks out and comforts scores of children orphaned by the genocide, and searches for love and companionship in a land where hatred still flourishes. She struggles along with her country to heal from the wounds of war and to keep hope, love, and forgiveness alive, then eventually emigrates to America to begin a new chapter of her life - a stranger in a strange land. With the same courage and faith in God that led her through the darkness of genocide, Immaculee discovers a new life that surpasses anything she could have imagined while growing up in a tiny village in one of Africa’s poorest countries. It is in the United States, her adopted country, where she can finally look back at all that has happened and truly understand why God spared her ... so that she would be left to tell her story to the world. In this best selling, Precalculus text, the authors explain concepts simply and clearly, without glossing over difficult points. This comprehensive, evenly-paced book provides complete coverage of the function concept and integrates substantial graphing calculator materials that help students develop insight into mathematical ideas. This author team invests the same attention to detail and clarity as Jim Stewart does in his market-leading Calculus text.

Put Your Dream to the Test

For the last twenty years astronomy has been developing dramatically. Until the nineteen-fifties, telescopes, spectrometers, and photographic plates consti tuted a relatively simple set of tools which had been refined to a high degree of perfection by the joint efforts of physicists and astronomers. Indeed these tools helped at the birth of modern astrophysics: the discovery of the expansion of the Universe. Then came radioastronomy and the advent of electronics; the last thirty years have seen the application to astrophysics of a wealth of new experimental techniques, based on the most advanced fields of physics, and a constant interchange of ideas between physicists and astronomers. Last, but not least, modern computers have sharply reduced the burden of dealing with the information painfully extracted from the skies, whether from ever scarce photons, or from the gigantic data flows provided by satellites and large telescopes. The aim of this book is not to give an extensive overview of all the tech niques currently in use in astronomy, nor to provide detailed instructions for preparing or carrying out an astronomical project. Its purpose is methodologi cal: photons are still the main carriers of information between celestial sources and the observer. How we are to collect, sample, measure, and store this information is the unifying theme of the book. Rather than the diversity of tech niques appropriate for each wavelength range, we emphasize the physical and mathematical bases which are common to all wavelength regimes.

Student retention continues to be a vexing problem for all colleges and universities. In spite of the money spent on creating programs and services to help retain students until they achieve their academic and personal goals, and graduate, the figures have not improved over time. This is particularly true for minority students, who have a greater attrition rate than majority students. Demographic information shows that the minority population in the United States is growing at a faster rate than the majority. It is imperative that educational institutions find ways to help improve retention rates for all students but particularly minority students. Retention rates should not differ appreciably among different racial/ethnic groups. “The Journal of College Student Retention: Research, Theory and Practice” is the only scholarly, peer-reviewed journal devoted solely to college student retention. It has published many articles on minority student retention, and this topic continues to garner much attention. This book is a compilation of the very best of these articles, selected on the basis of reviews by a cadre of experts in the education field. The articles discuss African American, Latino/Latina, Asian and Asian Pacific, Native American, and biracial students, and institutional commitments to retaining a diverse student population. For those interested in this vital area, the collection will teach and inspire them to achieve greater heights and pay additional attention to retaining minority students in our colleges and universities.

Arts education is often said to be a means of developing critical and creative thinking. This report examines the state of empirical knowledge about the impact of arts education on these kinds of outcomes.

Epistemology is the study of how “knowledge” is formed. Standard epistemology isolates the “known” from the “knowers,” thereby defining “knowledge” as objectively constant. Multiple epistemologies suggest that individuals learn in different ways shaped by life factors such as education, family, ethnicity, history, and regional beliefs. In this groundbreaking volume, editors Peter V. Paul and Donald F.

Moore call on ten other noted scholars and researchers to join them in examining the many ways that deaf people see and acquire deaf knowledge. This collection considers three major groups of deaf knowledge perspectives: sociological and anthropological, historical/psychological and literary, and educational and philosophical. The first explores the adoption of a naturalized, critical epistemological stance in evaluating research; the epistemology of a positive deaf identity; how personal epistemologies can help form deaf education policies; and valuing deaf indigenous knowledge in research. The next part considers dueling epistemologies in educating deaf learners; reforms in deaf education; the role of deaf children of hearing parents in creating Deaf epistemologies; and the benefit of reading literature with deaf characters for all students. The final part explores the application of the Qualitative-Similarity Hypothesis to deaf students’ acquisition of knowledge - a metaparadigm for literacy instruction in bilingual-bicultural education; collaborative knowledge-building to access academia; and examination of the benefits and disadvantages of being deaf.

Known for its thorough coverage of diversity, animal physiology, ecology, and environmental issues, this comprehensive book engages students in asking and answering questions during the course. Biology: Life on Earth helps instructors and students manage a wealth of scientific information in a manner that is both meaningful and long-lasting for students. The authors encourage students to learn according to their own style, and to relate this information to their own lives. In each chapter, the Eighth Edition of this trusted biology resource features significant content revisions as well as new figures and photographs.

The world ’s most revered and eloquent interpreter of evolutionary ideas offers here a work of explanatory force unprecedented in our time—a landmark publication, both for its historical sweep and for its scientific vision. With characteristic attention to detail, Stephen Jay Gould first describes the content and discusses the history and origins of the three core commitments of classical Darwinism: that natural selection works on organisms, not genes or species; that it is almost exclusively the mechanism of adaptive evolutionary change; and that these changes are incremental, not drastic. Next, he examines the three critiques that currently challenge this classic Darwinian edifice: that selection operates on multiple levels, from the gene to the group; that evolution proceeds by a variety of mechanisms, not just natural selection; and that causes operating at broader scales, including catastrophes, have figured prominently in the course of evolution. Then, in a stunning tour de force that will likely stimulate discussion and debate for decades, Gould proposes his own system for integrating these classical commitments and contemporary critiques into a new structure of evolutionary thought. In 2001 the Library of Congress named Stephen Jay Gould one of America ’s eighty-three Living Legends—people who embody the “ quintessentially American ideal of individual creativity, conviction, dedication, and exuberance. ” Each of these qualities finds full expression in this peerless work, the likes of which the scientific world has not seen—and may not see again—for well over a century.

This introduction to algebraic number theory via the famous problem of “Fermat’s Last Theorem” follows its historical development, beginning with the work of Fermat and ending with Kummer’s theory of “ideal” factorization. The more elementary topics, such as Eulers proof of the impossibility of x+y=z, are treated in an uncomplicated way, and new concepts and techniques are introduced only after having been motivated by specific problems. The book also covers in detail the application of Kummer’s theory to quadratic integers and relates this to Gauss’ theory of binary quadratic forms, an interesting and important connection that is not explored in any other book.
