This book represents the most current development on the expanding and changing field of telemedicine and e-health, especially in the developing countries. Many things have changed since the publication of the first book in 2004 (Establishing Telemedicine in Developing Countries: From Inception to Implementation). Telemedicine has become more popular, and still continues to grow. While there are many good books and materials on telemedicine, this publication can be seen at the work of reference for all of those who want to practice telemedicine and e-health, particularly in developing countries. This publication deals with ways to establish telemedicine and e-health system, not only in the developing countries, but also in the developed world. Hopefully, this book will be a guide that reflects the status of telemedicine at the given time. It is dedicated to all future generations of telemedicine and e-health students which include healthcare practitioners, administrators, policy makers, technical professionals and others.

*This book is open access under a CC BY-NC 2.5 license. The book aims to be a resource for those interested in planning and implementing large-scale information infrastructures for novel electronic services in health care. The focus of this book is on the pivotal role of the installed base (i.e. the already existing elements of an infrastructure) for ensuing infrastructural development. The book presents rich empirical cases on the design, development and implementation of core infrastructural components (e-prescription and public patient-oriented web platforms) in different national settings across Europe. Therefore, this is a book in which theoretical insights and practical experiences are tightly connected. Contributions have been sourced from a network of academics that have been working on the topic for years, and who have previously collaborated and shared a common understanding of the challenges entailed in expanding information infrastructures within healthcare. The book aims to become a reference for those seeking theoretical and empirical insights for conceptualizing and steering the evolution of information infrastructures in healthcare. The two types of systems (e-prescription and public patient-oriented web platforms) have been selected because they are widespread across Europe, because they invite comparisons, and because they are exemplary of two different types of aims. E-prescription initiatives are usually seen as opportunities to improve healthcare delivery by systematic and not dramatic change. Public patient-oriented web platforms are seen as opportunities to pursue wider and more radical innovation. This book targets researchers, practitioners and students who would benefit from a book providing a comprehensive view to contemporary approaches for the design and deployment of large-scale, inter-organizational systems within healthcare.*
